

## SERVICE SOLUTION

VALTO 360° is a service solution that we use to virtualize the operating and production environment of our customers. We use 360° panoramic images to make a functional operating environment that is attached with the required object information.

With virtualization, we make it easier to visualize the operating environment, access object information, and share and structure the information. If necessary, VALTO 360° sends and receives various messages.

The operating environment consists of group-specific views. Different staff groups and partners have their own group-specific functions in accordance with their tasks and needs.

The service is used with a web browser, with both virtual and augmented reality interfaces.

We implement the service as either a Software-as-a-Service (SaaS) cloud service or an On-Premise solution for the customer's own network. If necessary, we also integrate the service solution into user-selected systems.
